Group Project Kōans

ShanghAl Lectures 2017

"A **Kōan** (公案) ... is a story, dialogue, question, or statement, which is used in Zen-practice to provoke the 'great doubt', and test a student's progress in Zen practice."

Wikipedia

Koan 1: Wearable soft robotics

- Soft robotics provides tools for making safe and comfortable wearable devices ranging from power-assist and rehabilitation to shape-changing clothing.
- Design a wearable soft device, and fabricate a prototype of it. Use your imagination.
- Good places to start for ideas:
 - Soft Robotics Toolkit* Ο
 - PneuFlex Tutorial** Ο
 - JamSheets*** Ο
- How is the soft mechanism coupled with the human body? • How is this related to the lecture topics?

Do you have other ideas? Feel free to be creative!

Kōan 2: Throwing robot with elastic energy storage

- Humans are capable of impressive throwing performance with spears, balls, etc
- We actively use a backstroke to increase the velocity of the projectile on release
- Our elastic muscle-tendon structure enables energy storage during the backstroke
- Design and build a robot arm that exploits elasticity to enable faster-than-actuator throwing movements
- Explore the role of the backstroke, and compare with human motor control literature

Optimal throwing is hard, see background below. Can you simplify with bio-inspiration? Braun, D.J., Howard, M. and Vijayakumar, S., 2012. Exploiting variable stiffness in explosive movement tasks. Robotics: Science and Systems VII, p.25.

Checkout the **qbmove**-based 2 DOF robot throwing: <u>https://youtu.be/iPfGOKRIFJc</u>

Can you do better, perhaps more human-like? A longer backstroke?

Hammer in a nail instead?

Do you have other ideas? Feel free to be creative!

Kōan 3: Orchestrated control for shapechanging passive walkersDo you have other ideas?
Feel free to be creative!

- A passive dynamic walker exploits its own intrinsic dynamics to generate a "natural" and energy-efficient gait, but with several limitations:
 - It typically requires a downward slope for adding energy
 - It is typically limited to a very even and obstacle-free surface
- Could you exploit the compliance or change shape to change speed? Where?

65 km on one charge - the Cornell Ranger:

P. Bhounsule, et al., Low-bandwidth reflex-based control for lower power walking: 65 km on a single battery charge, International Journal of Robotics Research, vol. 33 no. 10, pp. 1305-1321, 2014. DOI: 10.1177/0278364914527485.

http://ijr.sagepub.com/content/33/10/1305.refs.html

Do you have other ideas? Feel free to be creative!

Kōan 4: A soft touch

- Explore designs of hands (and arms?) with different degrees of passive compliance.
 - E.g. rigid links connected by springs
 - Implement a physical design
 - Optionally model in e.g. VoxCad*
- What objects can be "grasped" when:
 - Hand falls on top by gravity?
 - One, two or more actuators are used? 2, 5 or more fingers?
- Discuss the impact on controller design and movement planning required

*http://www.creativemachineslab.com/voxcad.html

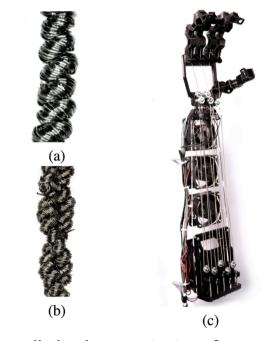

Check out the **Soft Robotics Toolkit** for inspiration:

http://softroboticstoolkit.com

Kōan 5: Variable-stiffness actuators

- Build a prototype joint with variable stiffness actuators, for example variable-stiffness agonistantagonist type
- Explore 'fabric-like' weaved designs
- Could you distribute control and sensing? How?
- Test and document the properties of the designed actuator, and compare with the state-of-the-art

A good starting point:

Haines, C.S., Lima, M.D., Li, N., Spinks, G.M., Foroughi, J., Madden, J.D., Kim, S.H., Fang, S., de Andrade, M.J., Göktepe, F. and Göktepe, Ö., 2014. Artificial muscles from fishing line and sewing thread. *science*, *343*(6173), pp.868-872.

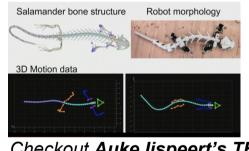

Example super-coiled polymer actuators, from: Yip, M.C. and Niemeyer, G., 2015, May. High-performance

robotic muscles from conductive nylon sewing thread. In 2015 IEEE International Conference on Robotics and Automation (ICRA) (pp. 2313-2318). IEEE.

Koan 6: A variable-stiffness and 3Dprintable snake robot

- Snake robots are being proposed for tasks in hardto-reach areas, e.g.:
 - Nuclear decommissioning
 - Underwater inspection
- Search the relevant literature to take inspiration from the skeletal and muscular structure of snakes
- What is role of stiffness variation for water and land snake locomotion?
- Build a 3D-printable snake robot (land and/or water) with variable stiffness

Perhaps start here, stiffness regulation in fish: Long, J.H. and Nipper, K.S., 1996. The importance of body stiffness in undulatory propulsion. *American Zoologist*, *36*(6), pp.678-694. Checkout the **qbmove**-based variable stiffness snake: https://youtu.be/khGqOYmWv3Q

Checkout **Auke Ijspeert's TED talk** on a 'soft' salamander for inspiration: <u>https://www.ted.com/talks/</u> <u>auke_ijspeert_a_robot_that_runs_and_</u> <u>swims_like_a_salamander?</u> language=en

> Do you have other ideas? Feel free to be creative!

Koan 7: Attractor States as the basis for Symbol Grounding

- Use the Puppy platform from Webots, or build your own
- Can Puppy categorize its gaits using its sensor input?
- What role do command data and proprioceptive data have?
- Why would Puppy need to change its gait? Environment and/or intrinsic motivation?

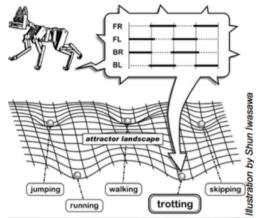

https://www.youtube.com/watch?v=dTAExarRs8w https://www.youtube.com/watch?v=UEV5jJJWhFE https://www.youtube.com/watch?v=iSr6adUvd_I

Attractor states

Pfeifer, R. and Bongard, J., 2006. *How the body shapes the way we think: a new view of intelligence*. MIT press.

Kōan 8: Learning how to swim like a fish

- Fossil remains of extinct fish give us insights on the evolution of species
- The way these species lived and moved can only be roughly estimated by looking at the features of the fossilized fishes
- Design a robot-fish¹ and a machine learning algorithm² allowing the fish to efficiently learn how to "swim" either in simulation³ or using a robot
- Can you gain insights on the way extinct fishes swam?
 - If yes, what can you tell about the fish from the obtained results?

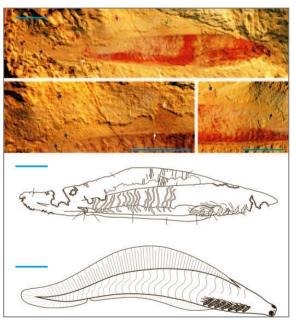

¹ Software or hardware.

² The proposed method would be applicable to different fishes and validated with non-extinct species of fish.

³ 2D simulator <u>here</u> or 3D simulator <u>here</u>.

Haikouichthys* lived 525 million years ago

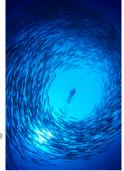

Zhang & Hou, 2004, p. 1163

Koan 9: "Useful" robot collaboration from local rules

- Implement a swarm of simple robots of your choice in a large virtual environment
- Use biological systems as inspiration, e.g. a flock of birds or school of fish
- Under "normal" behavior individuals follow three rules
 - Move in the same direction as your neighbours
 - Remain close to your neighbours
 - Avoid collisions with your neighbours
- There are two main events that trigger a reaction:
 - <u>Response to a predator attack</u>* (escape)
 - Response to food (gather)
- How to model these reactions?
- How may you control a swarm? How can you let it move from point A to point B?

* <u>https://youtu.be/m9mn7EB1H6k</u> <u>https://en.wikipedia.org/wiki/Swarm_behaviour</u> <u>https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2234121/</u>

Do you have other ideas? Feel free to be creative!

Koan 10: Softness and Stiffness of a swarm

- Implement a swarm of simple robots of your choice in a large virtual environment
- Use biological systems as inspiration, e.g. a flock of birds or school of fish
- Under "normal" behavior individuals follow three rules
 - Move in the same direction as your neighbours
 - Remain close to your neighbours
 - Avoid collisions with your neighbours
- How to model these reactions?
- How may you control the perceived/measured stiffness of a swarm? How could you measure it?

* <u>https://youtu.be/m9mn7EB1H6k</u> <u>https://en.wikipedia.org/wiki/Swarm_behaviour</u> <u>https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2234121/</u>

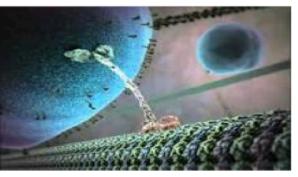

Do you have other ideas? Feel free to be creative!

Kōan 11: Model (part) of a cell as a swarm

- Implement a swarm of simple agents of your choice in a large virtual environment mimicking a set of cellular process ideally a cell
- Use biological systems as inspiration, e.g. a flock of birds or school of fish
- Under "normal" behavior individuals follow three rules
 - Move in the same direction as your neighbours
 - Remain close to your neighbours
 - Avoid collisions with your neighbours
- How to model these reactions?
- Why would a membrane help?

Do you have other ideas? Feel free to be creative!

* https://youtu.be/m9mn7EB1H6k

<u>k https://en.wikipedia.org/wiki/Swarm_behaviour</u> https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2234121/</u>

Kōan 12: Passive walkers on Mars

- Understand how passive wlakers walk down a slope
- Undestand how the Cornell Ranger walk
- What's the role of gravity?
- Design a passive walker for Mars surface and compare with terrestrilal ones
- What happens to human's brains on the ISS when moving???

You may start form here: http://ruina.tam.cornell.edu

Do you have other ideas? Feel free to be creative!

From Collins et al. 2001

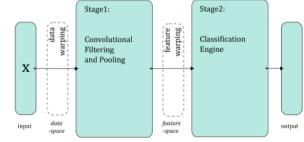

Koan 13: Exploiting Data Augmentation techniques using Convolutional Neural Networks and Body Morphology

Proposed by: Abdul Haleem Butt, Xiaojuan Mo, MD Riaz Pervez

- Deep learning Constraints?
- Should we use simulation?What we should simulate? is it helpful?
- Understanding data augmentation for classification: when to warp?
- •When it is better to conduct data augmentation in *dataspace* or *feature-space*?

Design of Body Aware Convolution Neural Network for the Classification of Parkinson and Healthy Subjects

Sebastien C Wong, Adam Gatt, Victor Stamatescu, and Mark D McDonnell. Understanding data augmentation for classification: when to warp? arXiv preprint arXiv: 1609.08764, 2016.

Kōan X: Define your own kōan

- Have an idea for a koan you would like to explore?
- Why not propose it, maybe other students are also interested!
- There are two main conditions:
 - The koan must be related to the topics covered in class
 - The group must be open to all students (max 6 in group)
- Contact us first, so we can help you organize:
 - Fabio Bonsignorio: <u>fabio.bonsignorio@gmail.com</u>
 - 莫小娟 Mo Xiaojuan: <u>momo152562@mail.nwpu.edu.cn</u>

Group allocation

- Assigned according to koan preference
 - Max 5 students per group
 - We aim to make groups as international as possible
- We encourage HW solutions (e.g. 3D printing)
 - Local core of students ok for local HW (contact us)
 - But must remain open to students from other sites
- Thinking outside of the box required!
 - No single "correct" answer to any of the Koans

Students' TODOs

- 1. Read through details of the different koans
 - This presentation will be available from website (koans tab)
 - A living document, may be updated as we go along
- 2. Register for participation in the koans by December 26 23:59 CET
 - Through (from this Saturday) the website or just drop an email by December 26 at the latest
 - Indicate your preferred ones (3 in order of preference)
 - You will be assigned group and tutor
